First Assignment Documentation

Project 1

- What I found easy:
    1. Linking the enter key input to the AddButton.
- What I found hard:
    1. Finding a typo after 30 minutes in the if statement I made/
- What I researched and what websites I used:
    1. Used w3schools to determine how to find out pressing enter will trigger the Add button.
    2. Used w3schools to find the keycode to enter, 13.
    3. Used w3schools to find how to make the dom focus on the text fields.
- How I worked:
    - 1st: Creating an event when the user clicks "enter"
    - 2nd: Making the widget focus on the text fields after the data has been entered.

What I did to accomplish the goal

1. Did some research on how to link the keys and focus on the text field.
2. Started with adding an event that activated when the Enter key was released
3. Linked the event to the addButton, which was simply to make an eventListener focused on the enter key that triggers the click event on the AddButton.

How I tackled the files needed to be edited:

- App.js – 10 minutes to search for the lines of code where I needed to be adding code.
- App.js – 20 minutes to add the lines of code after doing research
- App.js – 10 minutes to fix and typos and test the program.
